Semantic elements clearly describe their meaning to both developer and browser.

Key elements include `<header>`, `<nav>`, `<main>`, `<article>`, `<section>`, and `<footer>`.

2. FORM VALIDATION & ACCESSIBILITY

- Use `type="email"`, `type="number"`, and `required` attributes for instant browser validation.
- Always associate `<label htmlFor="...">` with input IDs to ensure screen reader support.
- Use ARIA roles `role="banner"`, `role="navigation"` when custom containers are needed.

3. KEY TAKEAWAYS

Semantic HTML improves SEO ranking, accessibility scores, and code maintainability.
