

React Hooks, Context API & State Architecture

Subject: React & Frameworks Architecture

=====

STUDYVAULT VERIFIED ACADEMIC NOTES & STUDY GUIDE

=====

1. REACT CORE HOOKS OVERVIEW

- useState: Manages local component reactive state.
- useEffect: Handles side-effects, API calls, and subscription cleanup.
- useContext: Subscribes to global context values without prop drilling.

2. COMPONENT LIFECYCLE & RE-RENDERING

Components re-render when props or state change. Use React.memo for heavy UI components.
